

Numbers in RED represent an estimate of the year of birth of the Most Recent Common Ancestor (MCRA) at that particular junction (node) (75% probability of being no earlier than that date).

\*Kit number N79686 has several unusual mutations, so may be an outlier, and not representative of that line. We need more data from other relatives to compare with.

\*Kit number 200675 is also an outlier.

\*Kits number 195735 and 163611 have a presumed relationship of 4C1R, dating to 1761, more than 250 years more recent than their predicted MRCA date of 1503.
